

Business Context — MCA Cross-Departmental Demand & Revenue Tracker

This document explains who the tool serves, the problem it replaced, and the value it delivers. It stands alone and assumes no prior knowledge of the organisation or of the workbook.

1. Background

The organisation is a major financial-markets business. Its **Brand and Marketing division** runs and supports marketing campaigns on behalf of several revenue-generating divisions:

Division / team	Campaign	What it promotes
Primary Markets	Beyond Capital Campaign	New listings and capital raising
Secondary Markets	Sales Campaign – Colocation	Trading services and colocation hosting
Information Services	Marketplace	Market data products
Issuer Services	Claim It Campaign	Services to listed companies and their shareholders
JSE Shelvests	Ticket Sales / Sponsorships	Investor education events for women
Digital Marketing	YouTube / Listings Streaming	Digital audience growth
Events	Listings / External Events	Listings ceremonies and external events
Marketing Services	Secondary Markets support	Cross-team marketing support

2. The problem

Campaign results were **scattered**. Each team kept its own record of leads and revenue, in its own format, on its own schedule. For the Marketing & Brands department this meant:

- **No single view of performance.** Comparing campaigns required chasing several files and reconciling formats.
- **Slow, manual reporting.** Month-end summaries were rebuilt by hand each cycle, repeating effort and inviting error.
- **Inconsistent definitions.** "This month" or "quarter to date" could mean different things in different files, so numbers did not reconcile.
- **No shared history.** Trends across the year were effectively invisible.

3. The solution

The Brand and Marketing division commissioned a single workbook with three design principles:

1. **One place, one format.** Every team records one row per day per business group — date, group, campaign, value. Drop-down validation keeps entries consistent, which is what keeps the automation reliable.
2. **Zero-maintenance reporting.** All period windows are anchored to today's date. When a new month or quarter begins, every comparison moves automatically; nobody edits a formula at period end.
3. **Two audiences, two views.** The **Dashboard** sheet answers the operational question — *how are we doing right now?* — for campaign owners. The **Analysis** sheet answers the management questions — *what is the trend, who contributes most, where should investment go?* — for department leadership.

4. Value delivered

- **A single source of truth.** All divisions' campaign performance is comparable at a glance, under one consistent set of metric definitions.
- **Time saved every month.** Month-end reporting changed from rebuilding a summary to reading one and writing a short commentary.
- **Better decisions.** Contribution and trend views make over- and under-performing campaigns visible early — for example, spotting that one campaign delivers roughly 29% of year-to-date revenue, or that a strong quarter was driven by a single month.
- **Data quality by design.** Validation at the point of entry prevents the misspelled category names and negative values that silently corrupt manual reports.
- **Continuity.** The in-workbook ReadMe page and the standalone documentation mean the tool survives staff changes; a new user is productive without a handover meeting.

5. Ownership and operating rhythm

- **Campaign owners** (each division/team) enter their daily rows and are accountable for their accuracy.
- **The analyst / workbook owner** (Brand and Marketing) runs the monthly review: verifies inputs, refreshes the written commentary, and communicates results. Structural changes — new campaigns, new groups — are made only by the owner.
- **Leadership** consumes the dashboards at the monthly review meeting.

6. Possible next steps

- Migrate inputs to a shared database or form once entry volume grows beyond comfortable manual entry.
- Rebuild the same model in Power BI for automatic distribution and drill-through, keeping this workbook as the collection layer.
- Add campaign cost data to report return on marketing investment alongside revenue per lead.
